Pedophile Uses Trojan Backdoor In Child Abuse

Arti Taru, Security Expert at MicroWorld Technologies says “Trojan backdoors can be employed by remote attackers to takeover a victim’s computer and to execute programs, reboot the system, open files, open webpages and so much more. It’s as if the intruder is operating his own desktop at free will.”

Increasing incidents like these call for advanced Virus Protection and futuristic Parental Control in every home, where kids and teenagers access the Internet.
