## Bettering Mail Servers for Enterprises

By [CXOtoday Staff](#)  
Mumbai, Oct 18, 2007

Enterprises can now avail of MicroWorld's new MailScan 5.3, the comprehensive security software for mail servers.

The new versions comprise a host of proactive technologies and advanced algorithms in various aspects of email security. The versions are compatible with Windows Vista and Windows 64 bit

platforms. Web registration of the product is also enabled in all of them.

MicroWorld has introduced SMTP Transparent Proxy in MailScan for SMTP and Exchange Server 2007. This will enable a Transport Layer Security (TLS) based communication between Hub Transport Server and Edge Transport Server. TLS is capable of authenticating both the client and the server, in order to create an encrypted connection between the two.

The new versions of MailScan for SMTP and exchange server also incorporate graylisting, a spam control tool. It's a method of blocking spam by temporarily rejecting mails coming from unknown senders. Legitimate mails if re-send from the originating server are accepted.

The software now provides POP3 authentication for accessing quarantined mails. Considering the fact that all enterprises will not have LDAP configured, this can provide them a means to authenticate valid users and restrict unauthorized access to quarantined mails.

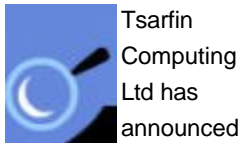

MailScan also uses NILP, which works on the principles of artificial intelligence and employs an adaptive mechanism in spam and phishing control.

The technology can analyze each email according to the nature of the business of an enterprise as well as the behavioral patterns of the user. It can take an informed decision thereafter.

Commenting on the antivirus technology used in MailScan, Govind Rammurthy, CEO of MicroWorld said, "All sorts of malicious programs like virus, worm, Trojan, backdoor, rootkit, bot, and phishing trojans are caught right at the Mail Gateway. Moreover, we use an advanced intention analysis of incoming objects to stop previously unknown threats."
