## Microworld releases Mailscan 5.3

by MarketFlash Bureau Mumbai

Oct 03, 2007

Microworld Technologies released Mailscan 5.3, the security software for Mail Servers. The company claims that the new versions are packed with a host of proactive technologies and advanced algorithms in various aspects of email security.

Compatible with Windows Vista and 64 bit platforms, Mailscan 5.3 has web registration and SMTP Transparent Proxy (TLS). TLS enables a Transport Layer Security based communication between Hub Transport Server and Edge Transport Server. It is capable of authenticating both the Client and the Server in order to create an encrypted connection between the two.

Graylisting is a powerful spam control tool that the new versions of Mailscan for SMTP and Exchange Server incorporate in them. It is a method of blocking spam by temporarily rejecting mails coming from unknown senders. If the mail is legitimate, the originating server in most cases will re-attempt to send it, which will then be accepted.

The software provides POP3 authentication for accessing quarantined mails. Considering the fact that not all Enterprises will have LDAP configured, this can provide them a means to authenticate valid users and restrict unauthorized access to quarantined mails.

Speaking on the occasion of the launch, Govind Rammurthy, CEO, Microworld explained how the product counters the deluge of unwanted mails. He said, “We use a multilayered mechanism in Spam Control. Several technologies like Real-time Black List, SURBL, General Header Tests, MX/A DNS Record Verification, X-Spam Rules Check, Non Intrusive Learning Patterns and Gray Listing are used in the process so that we deliver the best accuracy in filtering mails”.

On the AntiVirus technology used in Mailscan, Rammurthy said, “All sorts of malicious programs like Virus, Worm, Trojan, Backdoor, Rootkit, Bot, and Phishing Trojans are caught right at the Mail Gateway. Besides our earliest updating Anti-virus system that provides immediate vaccines against new and emerging threats, we also use an advanced Intention Analysis of incoming objects to stop previously unknown threats”.

NILP is another tool used by Mailscan in Spam and Phishing Control. It is a technology that works on the principles of Artificial Intelligence, which employs an adaptive mechanism in Spam and Phishing Control. This technology can analyze each email according to the nature of the business of an enterprise as well as the Behavioral Patterns of the user and can take an informed decision there after.
