

MicroWorld
Technologies launches
MailScan 5 for Mail
Servers with advanced
Spam Filtering

01 February 2007

MicroWorld Technologies has launched MailScan 5 for Mail Servers, the comprehensive Mail Security Solution at the Mail Gateway of organizations and business houses.

eMail is a vital part of the present day business communication for enterprises of all segments and sizes. And it's of paramount importance to safeguard the email infrastructure from a multitude of threats like Viruses, Worms, Trojans, Backdoors, Spamming and Phishing.

MailScan works at "TCP/IP Port level" and hence does not require an additional machine to act as a gateway. It's powered by the revolutionary 'MicroWorld WinSock Layer' technology, the first of its kind in the world. Data packets coming at different TCP/IP ports are assembled at the MWL Layer and get scanned for Malware before and after the Mail Server sends or receives mails.

With MailScan 5, MicroWorld is introducing a new technology in Spam Fighting named as NILP (Non Intrusive Learning Patterns). NILP is an advanced Spam Filtering method based on the principles of Artificial Intelligence, with the ability to analyze each email according to the Behavioral Patterns of the user and take an informed decision there after. This system comes with an inbuilt capability to learn on its own and makes the most accurate decisions in weeding out spam.

Some key features of MailScan are a combination of other technologies used for multi-layered Spam Filtering, Power to block Image Spam, TCP Connections, LDAP Authenticated Administration, Real-Time Antivirus, Advanced Heuristics, Attachment Filtering, Autogenerated Spam Whitelist, Attachment & eMail Archiving, Real-Time Content Scanner, Integrated Mail Security Policies, Customized Disclaimers and Extensive Reports.

"If you are talking about a comprehensive, end-to-end protection for Mailing Systems, it ought to be right there at the Mail Gateway," said Govind Rammurthy, CEO of MicroWorld Technologies, at the launch of MailScan 5. "With the new version of MailScan, we empower the Mail administrator with some

future defining technologies that can intelligently detect and block all kinds of malicious programs in mails, filter out spam with impeccable accuracy and enforce a comprehensive Mail Security Policy for the entire organization. While we sharpen our precision in nailing down individual challenges in email security, never do we lose sight of the complete picture."
