MicroWorld Technologies launches MailScan 5 for Mail Servers with advanced Spam Filtering

MicroWorld Technologies has launched MailScan 5 for Mail Servers, the comprehensive Mail [Security](#) Solution at the Mail Gateway of organizations and business houses.

eMail is a vital part of the present day business communication for enterprises of all segments and sizes. And it's of paramount importance to safeguard the email infrastructure from a multitude of threats like Viruses, Worms, Trojans, Backdoors, Spamming and Phishing.

MailScan works at "TCP/IP Port level" and hence does not require an additional machine to act as a gateway. It's powered by the revolutionary 'MicroWorld WinSock Layer' technology, the first of its kind in the world. Data packets coming at different TCP/IP ports are assembled at the MWL Layer and get scanned for Malware before and after the Mail Server sends or receives mails.

With MailScan 5, MicroWorld is introducing a new technology in Spam Fighting named as NILP (Non Intrusive Learning Patterns). NILP is an advanced Spam Filtering method based on the principles of Artificial Intelligence, with the ability to analyze each email according to the Behavioral Patterns of the user and take an informed decision there after. This system comes with an inbuilt capability to learn on its own and makes the most accurate decisions in weeding out spam.

Some key features of MailScan are a combination of other technologies used for multi-layered Spam Filtering, Power to block Image Spam, TCP Connections, LDAP Authenticated Administration, Real-Time Antivirus, Advanced Heuristics, Attachment Filtering, Autogenerated Spam Whitelist, Attachment & eMail Archiving, Real-Time Content Scanner, Integrated Mail [Security](#) Policies, Customized Disclaimers and Extensive Reports.

"If you are talking about a comprehensive, end-to-end protection for Mailing Systems, it ought to be right there at the Mail Gateway,"

said Govind Rammurthy, CEO of MicroWorld Technologies, at the launch of MailScan 5. "With the new version of MailScan, we empower the Mail administrator with some future defining technologies that can intelligently detect and block all kinds of malicious programs in mails, filter out spam with impeccable accuracy and enforce a comprehensive Mail [Security](#) Policy for the entire organization. While we sharpen our precision in nailing down individual challenges in email [security](#), never do we lose sight of the complete picture."

EDITOR'S CHOICE:

Develop an ISO 27001 / BS7799-compliant Information Security Management System

The hardest, most exhausting part of achieving ISO 27001 / BS7799 certification is the documentation of the Information Security Management System (the ISMS). That's why many organizations turn to outside consultants. But consultants are expensive and don't necessarily leave an organization owning the ISMS. The logical alternative is to buy a set of model pre-written policies and procedures:

The [ISMS Documentation Toolkit](#) is a unique product, costing less than a day of a consultant's time and packaged with 12 months of online drafting support and advice. It makes it easier for organizations of all sizes, anywhere in the world, to succeed with a ISMS project. You should buy this toolkit products and use it in your business. Follow this link and buy the [ISO 27001 / BS7799 ISMS Documentation Toolkit](#).
